

M.S. Graduate Research Assistantships in Native Plants Available at Utah State University

This is a research assistantship opportunity at Utah State University (Logan, UT) for two M.S. students interested in native plant ecophysiology and/or native plant materials development. Our purpose is to perform research in support of development of restoration plant materials for the semi-arid Intermountain West, e.g., desirable plant/weed competition, seedling establishment, drought resistance, or genetic diversity. Students may affiliate with either the Dept. of Forest, Range, and Wildlife Sciences (College of Natural Resources) or the Dept. of Plants, Soils, and Biometeorology (College of Agriculture). We have financial support, excellent field and greenhouse facilities, state-of-the-art facilities and equipment, meaningful interaction with land management agencies and the seed industry, and a beautiful mountain setting. We currently have a native plant graduate group of about 20 students and 26 faculty operating across four departments and four colleges at the university. For more information, contact Tom Jones (435-797-3082, tomjones@cc.usu.edu).
